# Motivation

Learning  
Stateful  
Models for  
Network  
Honeypots

Tammo Krueger  
Hugo Gascon  
Nicole Krämer  
Konrad Rieck

## Motivation

### PRISMA

Preprocessing  
Embedding  
Feature  
Selection  
Event Clustering  
Markov Model  
Templates and  
Rules

### Example

### Evaluation

Data Sets  
Correctness

### Outlook

Given a pool of client/server communication infer generic messages and abstract state machine

- 1 To emulate services (honeypots)
- 2 Lure attackers
- 3 Gather information about threat potential

# Motivation – Protocol Inspection and State Machine Analysis (PRISMA)

Learning  
Stateful  
Models for  
Network  
Honeypots

Tammo Krueger  
Hugo Gascon  
Nicole Krämer  
Konrad Rieck

## Motivation

### PRISMA

Preprocessing  
Embedding  
Feature  
Selection  
Event Clustering  
Markov Model  
Templates and  
Rules

### Example

Evaluation  
Data Sets  
Correctness

### Outlook

By embedding and event clustering approximate abstract state machine and message types:

- Infer *Markov model* of the behavior
- Find inherent structure of the messages (*templates*)
- Gather information flow between states (*rules*)

# System Overview

*Derrick & Harry*

Event Clustering

Markov Model

Templates and  
Rules

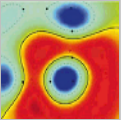

Example

Evaluation

Data Sets  
Correctness

Outlook

- Data acquisition via `tcpdump`
- Tool chain needed, to process these binary dump files
  - **Derrick** reassembles packets (removes IP fragmentation)
  - **Harry** concatenates packets to messages and extracts session information
- Data available for the next steps:
  - 1 messages as sequence of bytes (input for *embedding*)
  - 2 sessions as sequence of messages (input for *Markov model*)

PRISMA

Preprocessing

Embedding

Feature  
Selection

Event Clustering

Markov Model

Templates and  
Rules

Example

Evaluation

Data Sets

Correctness

Outlook

- 1 **N-grams:** Given the set of all possible n-grams over byte sequences  $S = \{0, \dots, 255\}^n$ , we define the embedding function  $\phi : \{0, \dots, 255\}^* \mapsto \mathbb{R}^{|S|}$  as

$$\phi(x) = (\phi_s(x))_{s \in S} \quad \text{with} \quad \phi_s(x) = \text{occ}_s(x).$$

Example ( $n = 3$ ):

$$\phi(\text{"Hello"}) = (0, \dots, \overset{\text{Hel}}{1}, \overset{\text{ell}}{1}, \overset{\text{llo}}{1}, \dots, 0)^T \in \mathbb{R}^{16777216}$$

- 2 **Tokens:** Given a set of separators  $Sep$  we can split the byte sequence into tokens; example ( $Sep = \{\_ \}$ ):

$$\phi(\text{"We'll meet again"}) = (0, \dots, \overset{\text{We'll}}{1}, \overset{\text{meet}}{1}, \overset{\text{again}}{1}, \dots, 0)^T \in \mathbb{R}^?$$

PRISMA

Preprocessing  
Embedding

**Feature  
Selection**

Event Clustering  
Markov Model  
Templates and  
Rules

Example

Evaluation

Data Sets  
Correctness

Outlook

- Some features do not carry real information:
  - Fixed, *constant* tokens (protocol, e.g. HTTP/1.1)
  - Random, *volatile* tokens (cookies, nonces, ...)
- Focus the analysis by splitting the feature set  $F$ :

$$F = F_{constant} \cup F_{variable} \cup F_{volatile}$$

- Calculate frequency  $\pi_f$  and test:

$$p_{constant} = \text{binom.test}(H_0 : \pi_f \approx 1.0)$$

$$p_{volatile} = \text{binom.test}(H_0 : \pi_f \approx 0.0)$$

- Adjust significance level  $\alpha$  for multiple testing
- Keep *variable* features, which are not *constant* **and** are not *volatile*:  $p_{constant} \leq \hat{\alpha} \wedge p_{volatile} \leq \hat{\alpha}$

# Event Clustering

- Clustering as factorization of embedding matrix  $X \in \mathbb{R}^{f,N}$  with  $B \in \mathbb{R}^{f,e}$ ,  $C \in \mathbb{R}^{e,N}$ ,  $b_i \in \mathbb{R}^{f,1}$ ,  $c_j \in \mathbb{R}^{e,1}$ ,  $e \ll f$ :

$$X \approx BC = \overbrace{\begin{bmatrix} b_1 & \dots & b_e \end{bmatrix}}^{\text{event basis}} \underbrace{\begin{bmatrix} c_1 & \dots & c_N \end{bmatrix}}_{\text{event assignments}}$$

via *Non-Negative Matrix Factorization*:

$$(B, C) = \arg \min_{B, C} \|X - BC\|$$

s.t.  $b_{ij} \geq 0, c_{jn} \geq 0$ .

- Optimized, replicate-aware NMF which works on duplicate-free  $\tilde{X}$
- Other techniques (e.g. hierarchical clustering, expert knowledge) can be incorporated easily

# Event Clustering – Replicate-Aware NMF

2:    $err = \infty$ 
3:   while  $|err - \frac{1}{2} \|\tilde{X} - BC\|^2| < \epsilon$  do
4:      $err = \frac{1}{2} \|\tilde{X} - BC\|^2$ 
5:      $\lambda = \text{RRbyCV}(\tilde{X}, B, I_{e,e})$ 
6:      $C = (B^T B + \lambda I_{e,e})^{-1} (B^T \tilde{X})$ 
7:      $C[C < 0] = 0$   $\triangleright$  Set all negative coordinates to 0
8:      $\lambda = \text{RRbyCV}(\tilde{X}^T, C^T, W)$ 
9:      $B = (\tilde{X} W C^T) (C W C^T + \lambda I_{e,e})^{-1}$ 
10:     $B[B < 0] = 0$   $\triangleright$  Set all negative coordinates to 0
11:     $B = B \text{diag}(1/\|b_1\|, 1/\|b_2\|, \dots, 1/\|b_e\|)$ 
12:     $C = C \text{diag}(\|b_1\|, \|b_2\|, \dots, \|b_e\|)$ 
```

# Event Clustering – NMF Tricks

Embedding  
Feature  
Selection

**Event Clustering**

Markov Model  
Templates and  
Rules

Example

Evaluation

Data Sets  
Correctness

Outlook

- Some useful tricks:
  - Initialize the  $B$  matrix with positive and negative components of a replicate-aware PCA:

$$b_j = \underset{\|b\|=1}{\operatorname{arg\,max}} \operatorname{var} \left( \tilde{X}^\top b \right)$$

s.t.  $b \perp b_j, j < i$

- $\text{RRbyCV}(Y, Z, W)$  estimates the optimal  $\lambda$  parameter for the ridge regression problem

$$\underset{\beta}{\operatorname{arg\,min}} \|Y - Z\beta\|_W^2 + \lambda \|\beta\|^2$$

→ efficient leave-one-out cross-validation possible!

- Estimating the inner dimension by simulated noise model
- Implemented in CRAN package PRISMA

Feature  
Selection

Event Clustering

Markov Model

Templates and  
Rules

Example

Evaluation

Data Sets  
Correctness

Outlook

- Each message is assigned to an *event* from the event space  $E$ , so a session  $S = [e_1, e_2, \dots, e_{|S|}]$ ,  $e_{1,2,\dots,|S|} \in E$
- Represent the dynamics for the system by a Markov model of order  $k \geq 2$ :
  - 1 Estimate the frequencies of the initial events (i.e.  $P(e)$ ,  $e \in E$ )
  - 2 Estimate the frequencies of an event given the  $m$  predecessors in time (i.e.  $P(e_t | e_{t-k}, \dots, e_{t-2}, e_{t-1})$ )
- Resulting networks can be big (potentially  $|E|^k$  nodes):
  - Markov model can be transformed in a DFA
  - Compress structure via DFA minimization algorithm

Session $n$	ftp 2.0	USER liz	331 User liz ok
Template	ftp <input type="checkbox"/>	USER <input type="checkbox"/>	331 User <input type="checkbox"/> ok

- Template generation:
  - Assign each message to its corresponding state
  - Align messages and find static and changing parts (*fields*)
- Rules between templates:
  - **Copy** Exact copy of one field to another.
  - **Seq.** Copy of a numerical field incremented by  $d$ .
  - **Add** Copy field and add data  $d$  to the front or back.
  - **Part** Copy front/back part of a field splitted by separator  $s$ .
  - **Data** Fill field with data  $d$  which we have seen before.

# Example – Koobface

- Data from G. Jacob et al. *Jackstraws: Picking command and control connections from bot traffic*. USENIX 2011
- Extraction of C&C communication via dynamic taint analysis
- Network traffic of one class of malware:
  - 147 sessions
  - 6,674 messages
- Model learning:
  - Token embedding
  - Replicate-aware NMF
  - Markov model  $k = 2$

Example

Evaluation

Data Sets  
Correctness

Outlook

- **SIP:** 7 days/20 users of telephony data
- **DNS:** Domain Name System requests of 7 devices inside a home network
- **FTP:** 10 days of File Transfer Protocol data set from the Lawrence Berkeley National Laboratory
- Train on 90% of the sessions and use rest for testing
- Evaluation of *completeness* shows that model is capable of generating content of hold-out sessions

# Evaluation – Correctness

- Test *correctness* of the models:
  - Check syntactical (*wireshark*) and semantical features of the simulated sessions
  - Unidirectional simulation uses one side of the hold-out sessions and simulates the other side
  - Bidirectional simulation in which both sides of the session are simulated (*M-x psychoanalyze-pinhead*)
- Check session semantic:
  - **SIP**: the *CallID*, *from-* and *to-tag* are preserved
  - **DNS**: If message is a reply check whether it was queried before and has the same query id
  - **FTP**: check, whether request and the returned reply code is valid according to the RFCs (959, 3659, 775, 2389)

# Evaluation – Correctness

Learning  
Stateful  
Models for  
Network  
Honeypots

Tammo Krueger  
Hugo Gascon  
Nicole Krämer  
Konrad Rieck

Motivation

PRISMA

Preprocessing  
Embedding  
Feature  
Selection  
Event Clustering  
Markov Model  
Templates and  
Rules

Example

Evaluation

Data Sets  
Correctness

Outlook

- Breakdown of cumulative syntactical and semantical correctness of sessions for the FTP data:

Msgs. Correct	Syntax		Semantic	
	Unidir.	Bidir.	Unidir.	Bidir.
100%	0.999	0.821	0.934	0.576
> 90%	1.000	0.953	0.988	0.878
> 80%	1.000	0.996	1.000	0.982
